Synopsis

- Post-Normal Science
- Typologies of citizen science and PNS
- Mapping typologies
- Insights
- Trajectories and the epistemic disruption of citizen science

Citizen science & Post-normal science

citizen science & STS

Post-normal science

- Developed by Silvio Funtowicz and Jerome Ravetz in the 1990s.
- Aimed at addressing science-policy interactions and highlights the complex and increasingly controversial role that science has to play in public life when dealing with problem that are common today
- This is a reflective approach that tries to address aspects that are normally left out of 'normal' science such when:
 - “Facts are uncertain, values in dispute, stakes are high, and decisions are urgent“

Decision stakes and uncertainty

Extended-peer communities

- “[It] consisting not merely of persons with some form or other of institutional accreditation, but rather of all those with a desire to participate in the resolution of the issue”. p.7
- Extending the peer review progress of science towards the public.
- Methods such as citizens’ juries, focus groups, consensus conferences.

Civic Science

Wiggins & Crowston 2011 - primary goals and physical environment

- **Action oriented** - encourage participant intervention in local concerns, using scientific research as a tool to support civic agendas.
- **Conservation**- support stewardship and natural resource management goals, primarily in the area of ecology.
- **Investigation** - focused on scientific research goals requiring data collection from the physical environment.
- **Virtual** - all project activities are ICT-mediated with no physical elements whatsoever.
- **Education** - education and outreach primary goals, all of which include relevant aspects of place.

Shirk et al. 2012 - 5 Cs classification

- **Contractual** - communities ask professional researchers to conduct a specific scientific investigation and report on the results;
- **Contributory** - generally designed by scientists and members of the public primarily contribute data;
- **Collaborative** - generally designed by scientists and members of the public contribute data, refine project design, analyse data, disseminate findings;
- **Co-Created** - designed by scientists and members of the public working together, some of the public participants are actively involved in most aspects of the research process; and
- **Collegial** - non-credentialed individuals conduct research independently with varying degrees of expected recognition by institutionalised science.

Modes of Citizen Science

Mode 4 'Extreme'

- Collaborative Science – problem definition, data collection and analysis

Mode 3 'Participatory science'

- Participation in problem definition and data collection

Mode 2 'Distributed Intelligence'

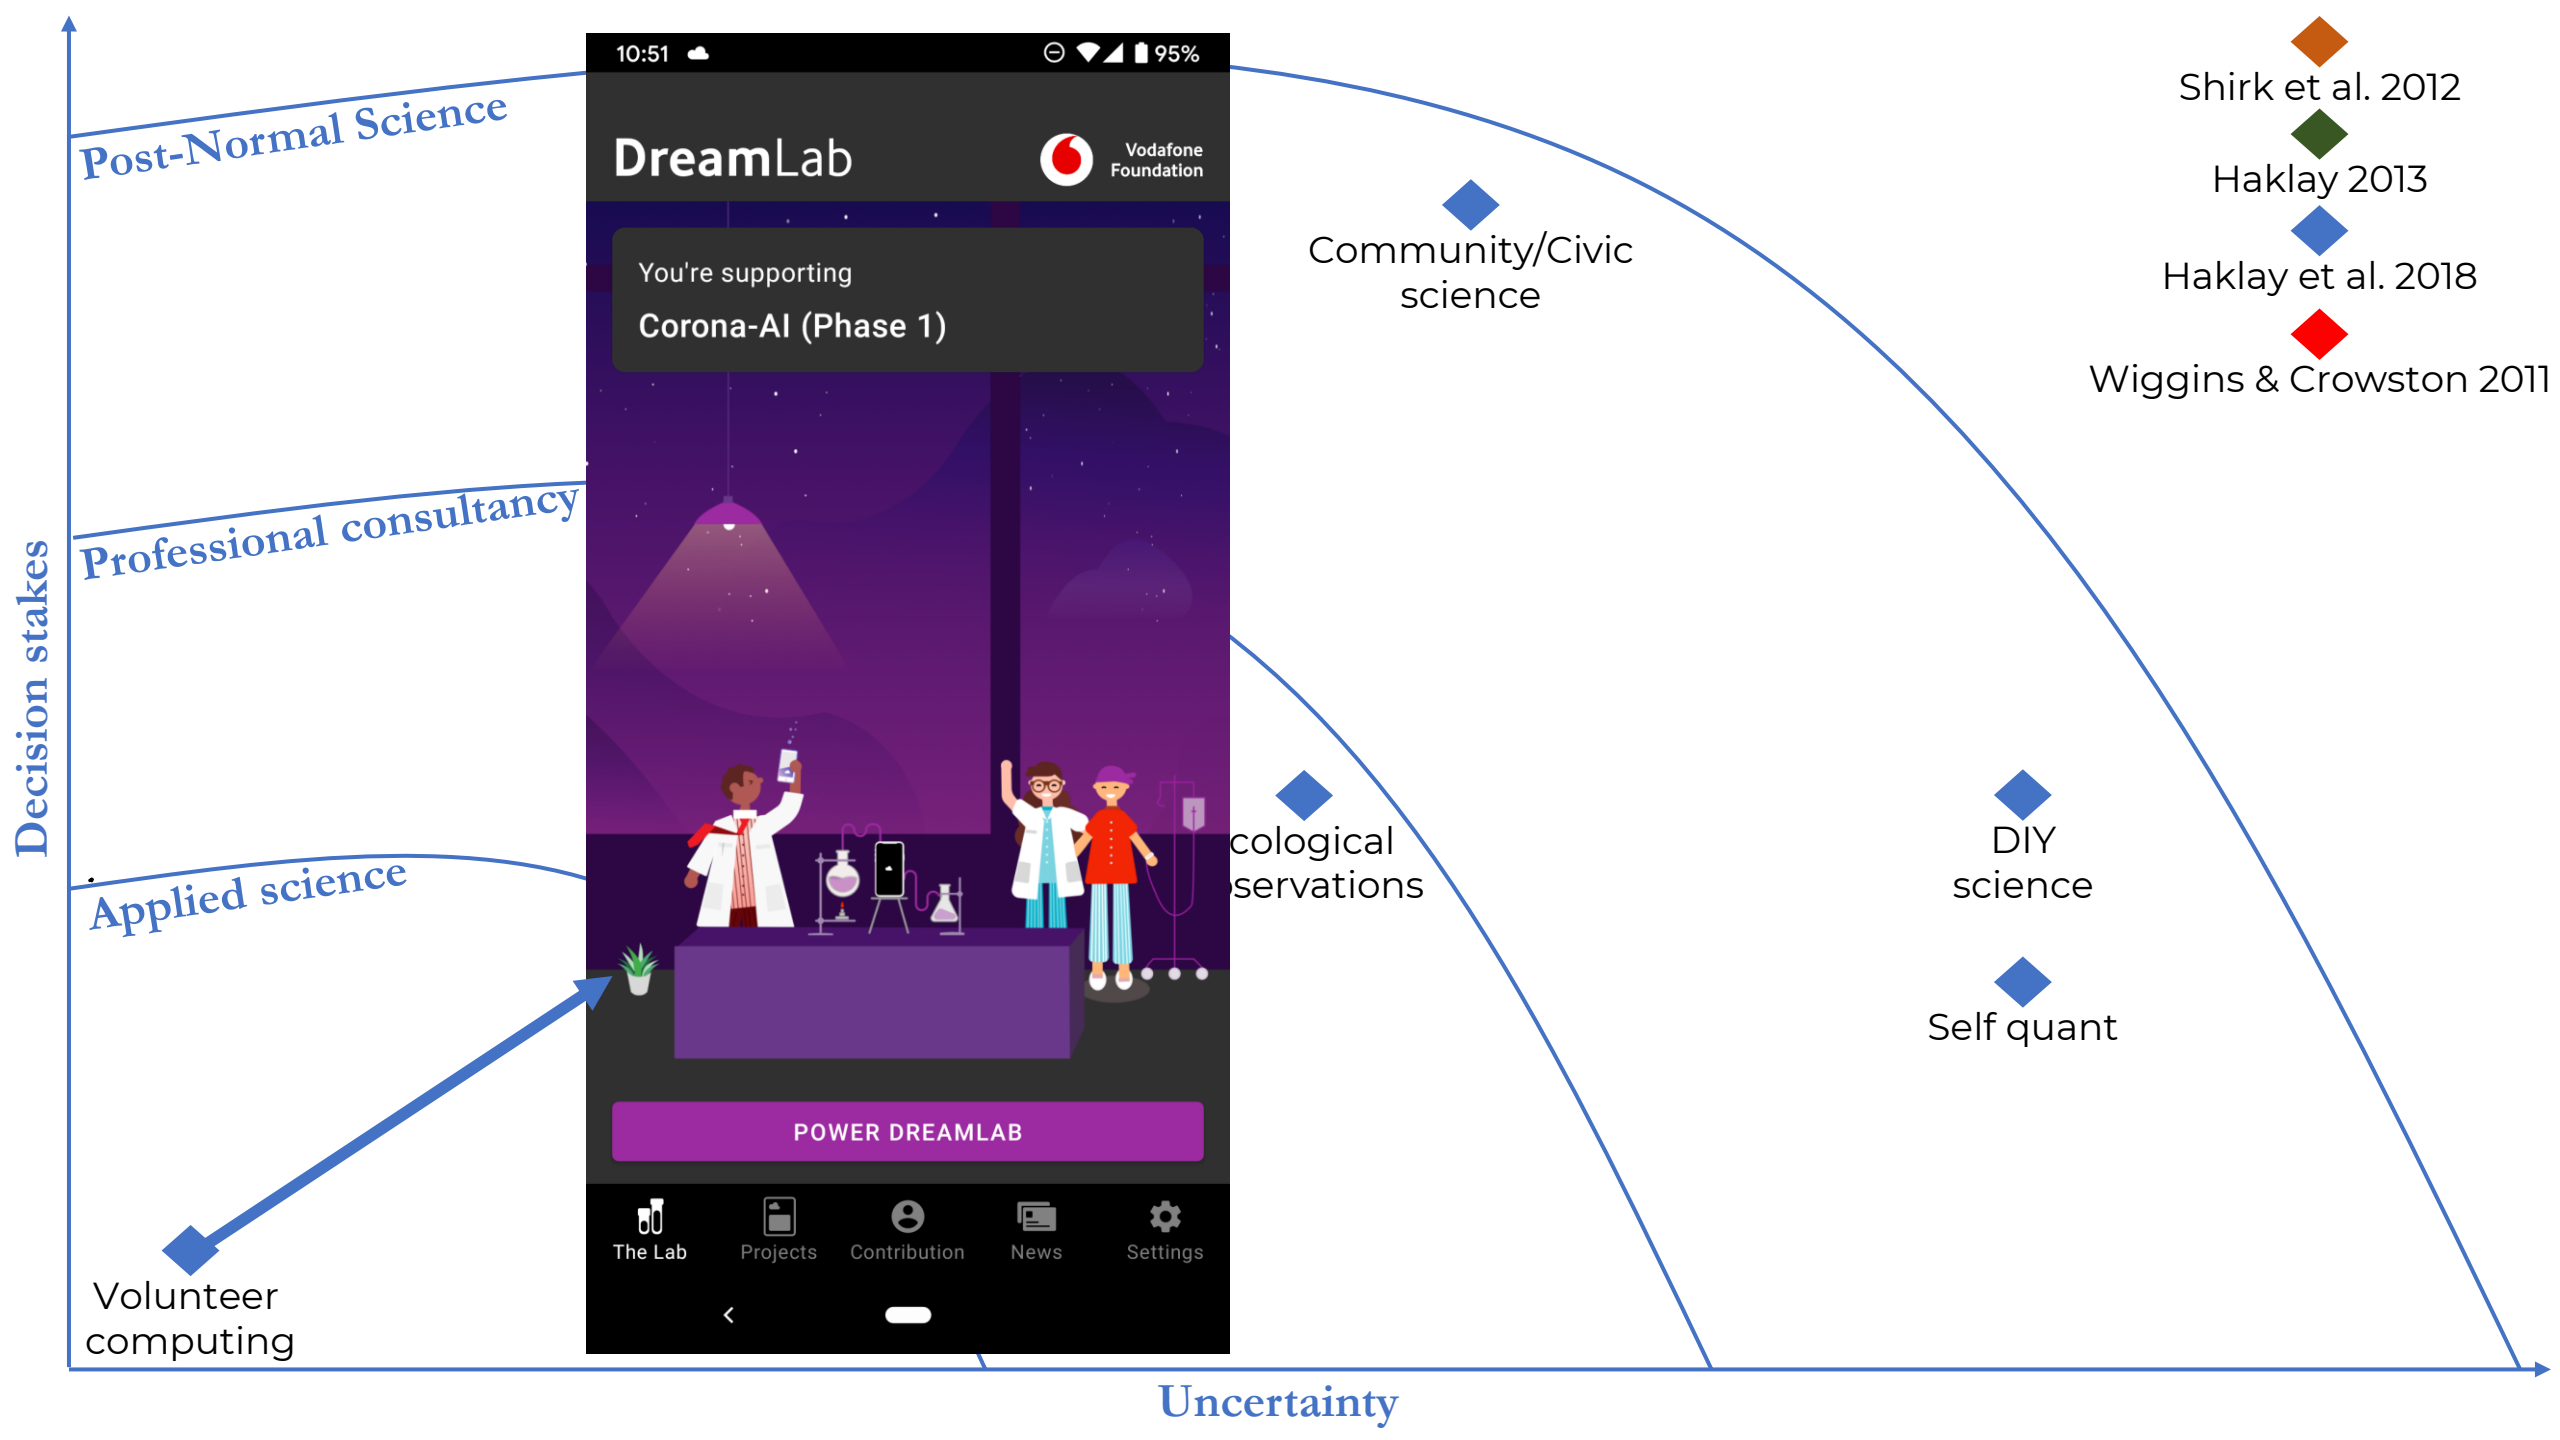

- Citizens as basic interpreters

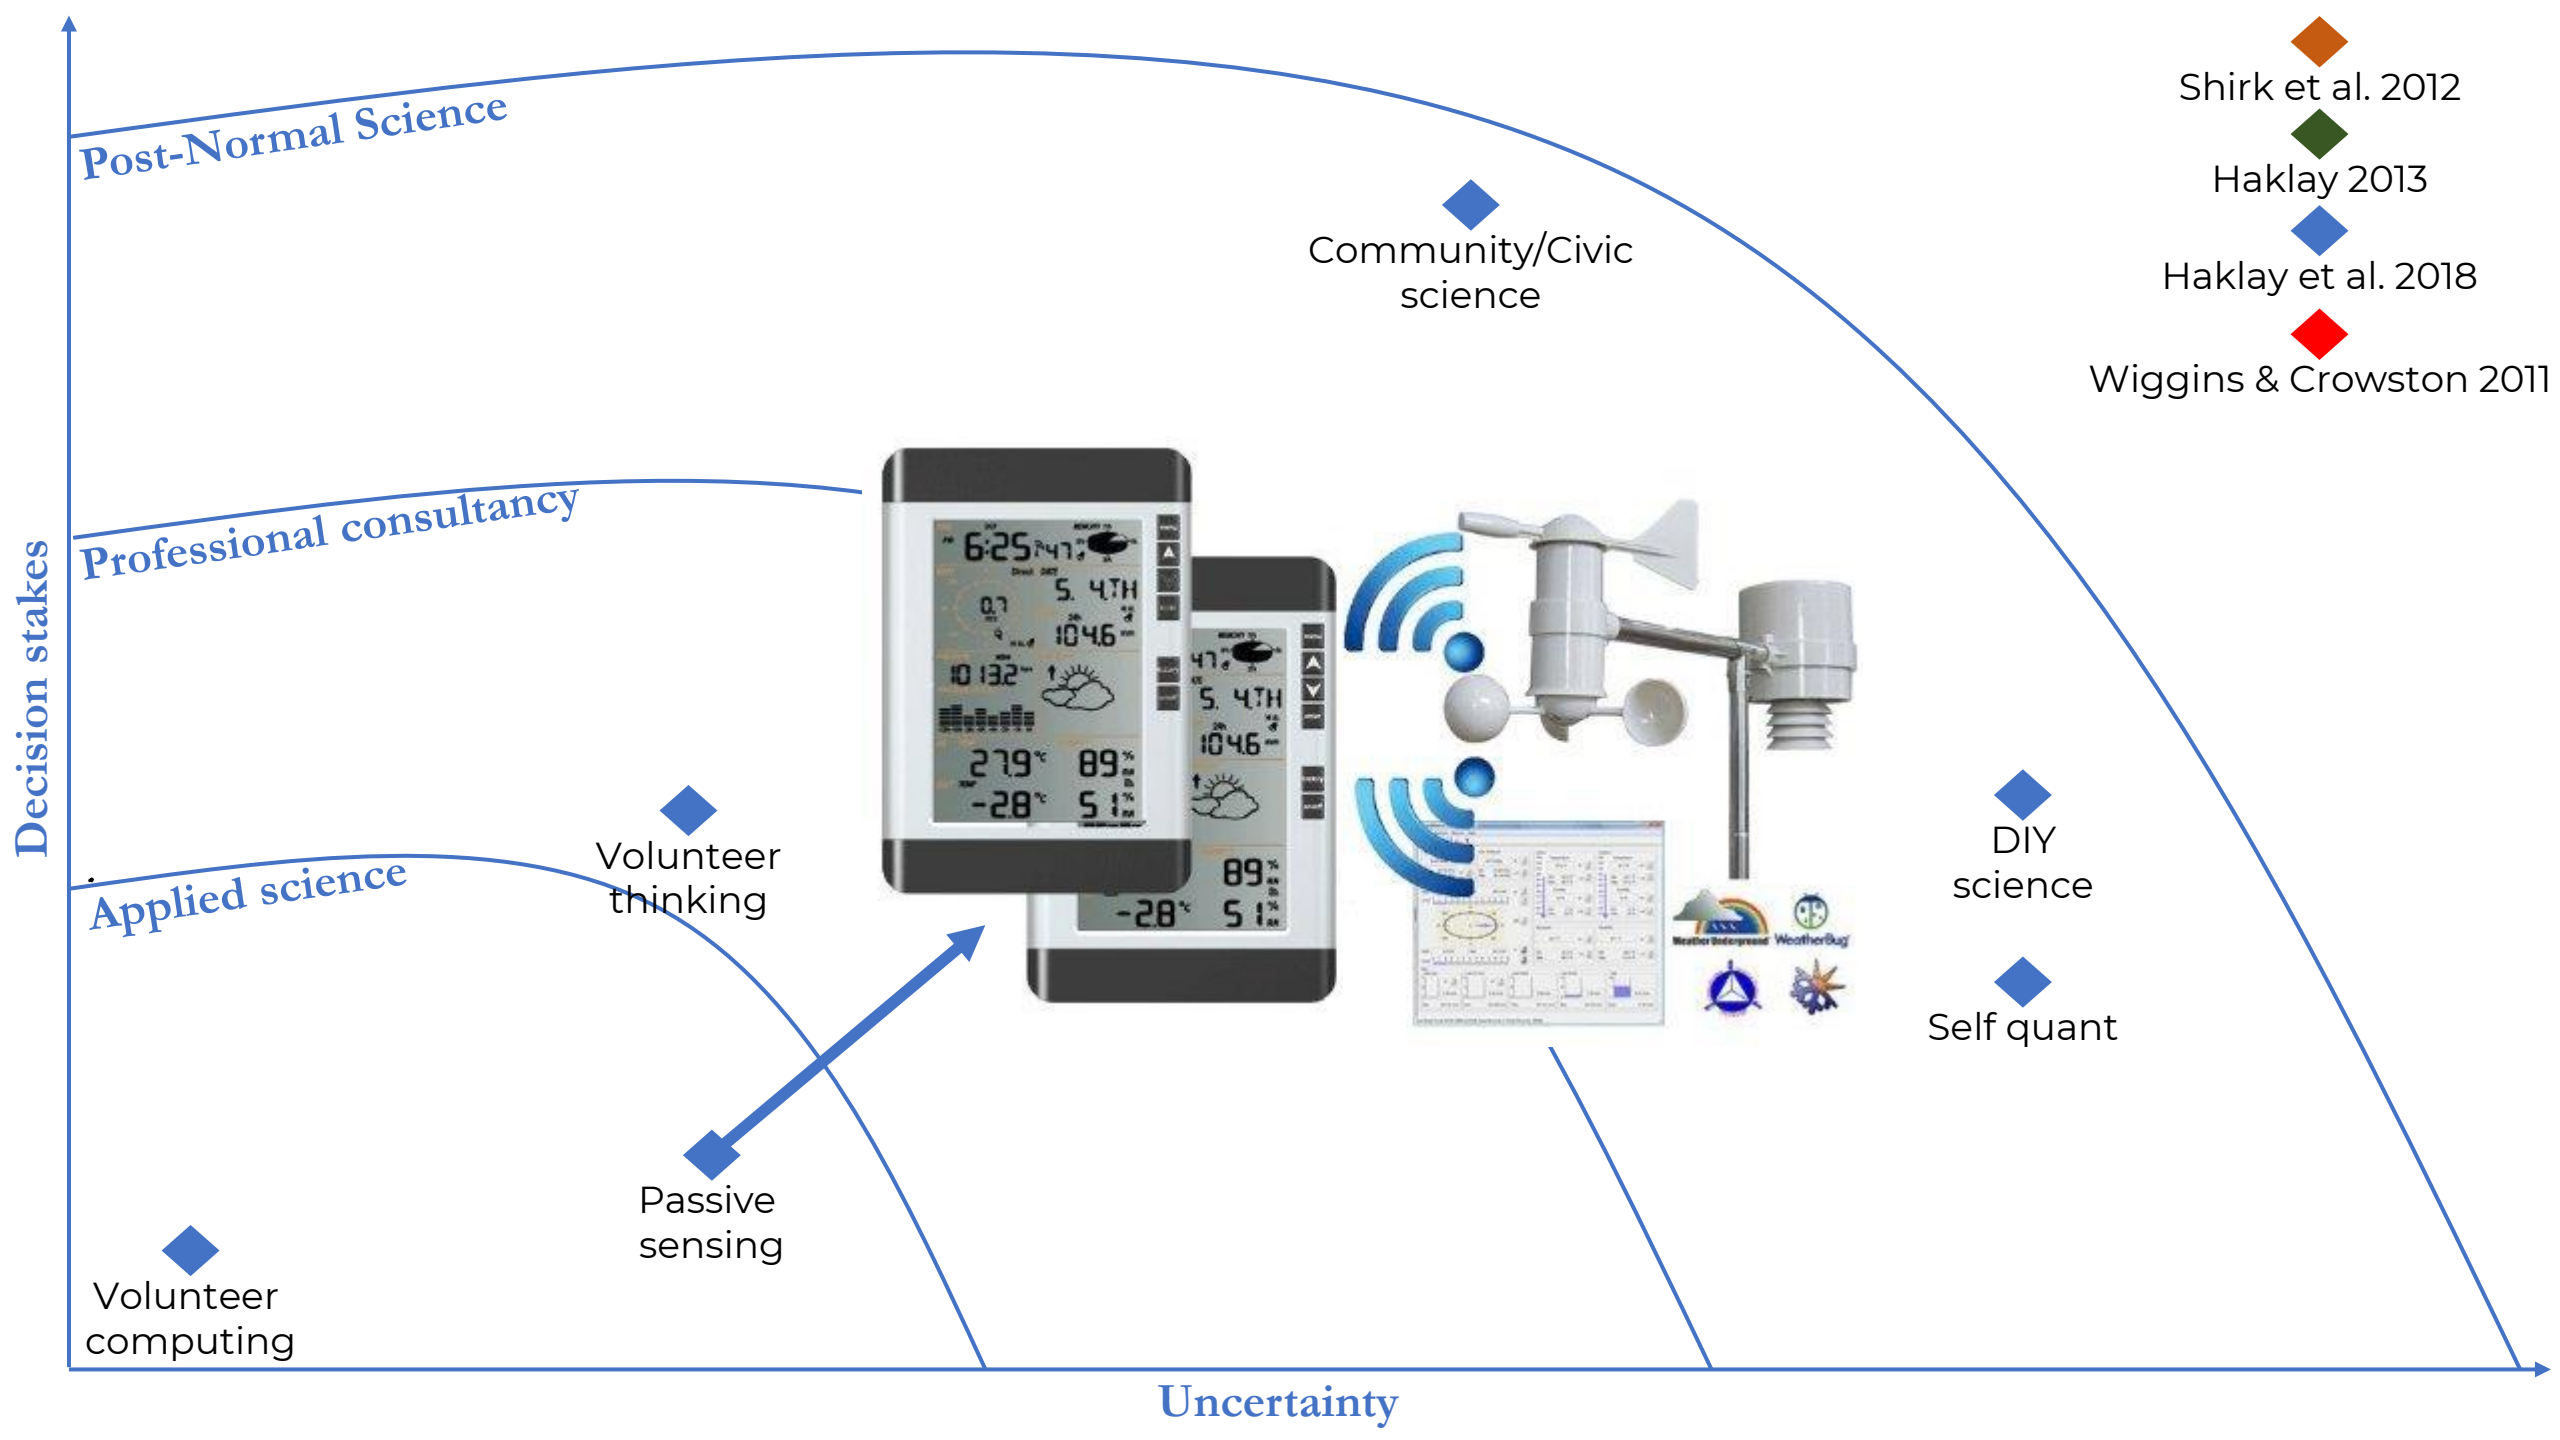

Mode 1 'Crowdsourcing'

- Citizens as sensors

Observations

- A lot (maybe most) citizen science activities are within the realm of normal science
- In terms of number of projects and participants, most are in the lower uncertainty and stakes, maybe due to the conceptual/organisational/status challenges from the project owner point of view
- Within the normal science, the democratisation is in the “who is allowed” and to a very limited degree in “how”, so not challenging ontology and methodology.

Conclusions

- **Practical aspects of your work** - which method of CS is useful for each problem-solving strategy zone

- **Challenges at the intersection between STS and CS** -

concepts such as extended peer community are more fuzzy and assumptions about them are lacking reliance on empirical data

trajectories analysis points to an epistemic disruption power of citizen science, which can explain the reluctance of scientists to allow it in
